

# Project Immersion

Project Immersion tries to bring your TV watching experience to a whole new level. Now, when you watch your favorite sports game, you yourself will be transported into the game! Form feeling the heartbeat of your favorite player to getting an explosion of color and vibrations when your team wins. Everything is possible with the power of the spark core in project Immersion.

## Website and app

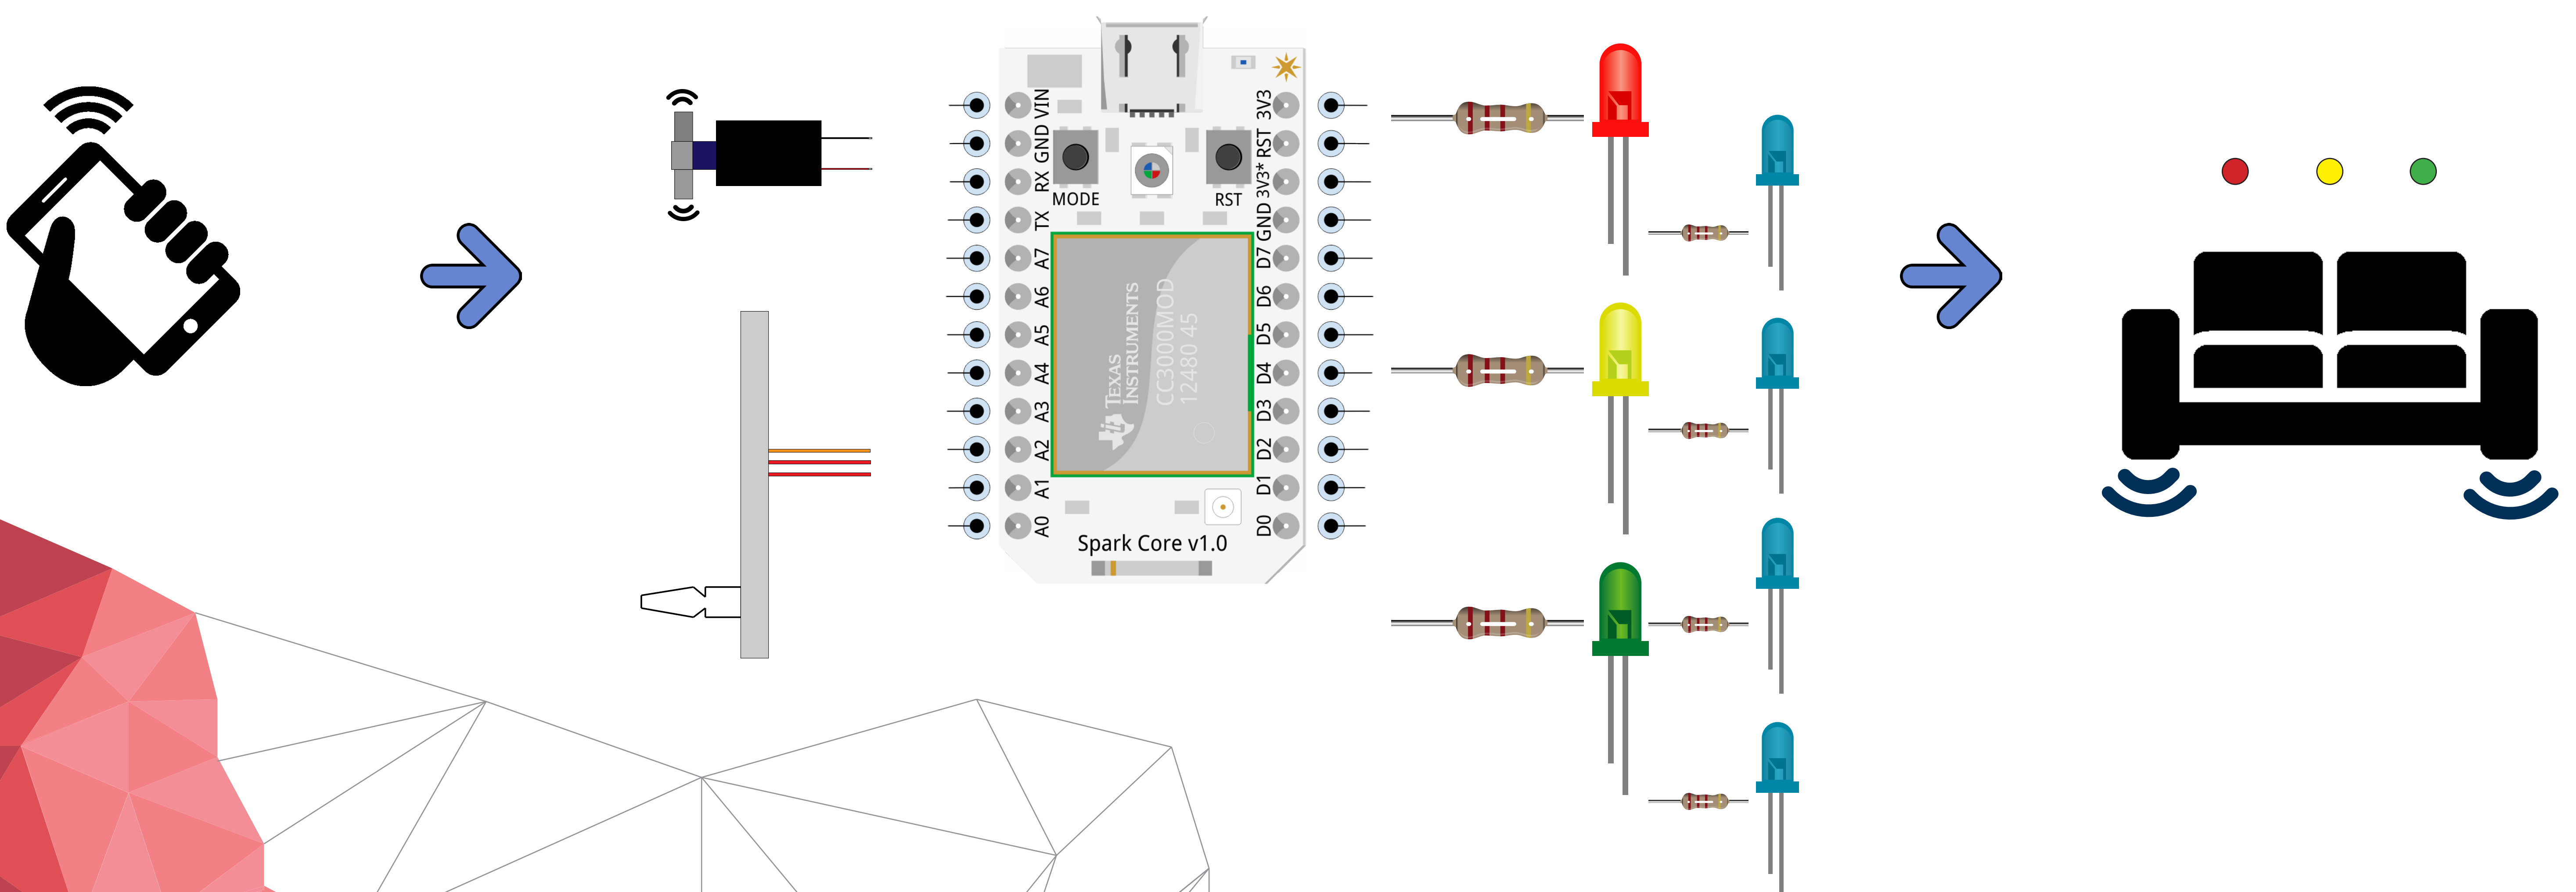

With the project Immersion website you can easily select the experience you want. The site is fully compatible with pc, mac, tablets or smartphones. Just click or tap on the mode you want and start having a good time !

## Technical side

Once you select a mode, the website or app will start communicating via Wi-Fi with the spark core. The core will start initiating the vibrate-motors (here presented by the motor and the 4 blue LED's) and the LED's. This way, a minimum of cables will be required.

The different functions of the spark core are programmed with a combination of java script and C++. The spark.io site gives developers an online tool for the coding.
